

Exploration and Potential of AI Generated Feedback for Promoting Cognitive Presence in Asynchronous Online Discussions

Christine Wusylko, Larisa Olesova, Bojan Lazarevic, & Swapna Kumar

Problem

Students struggle to construct and confirm meaning through reflections and discourse during online asynchronous discussions. This process is called cognitive presence (CP) (Garrison et al., 2001)

Can GPT-4.0 (Microsoft CoPilot) Large Language Model (LLM) be used to guide students' quality of posts in asynchronous online discussions?

Background

CP can be operationalized by the Practical Inquiry Model (PIM) (Garrison et al., 2001; Shea et al., 2010)

Ρ	hases	Categories	Descriptions
(2	1)	Triggering	Become aware of a problem by asking questions
(2	2)	Exploration	Explore a problem by searching or offering information
(3	3)	Integration	Integrate interpretations and construction of possible solution
(4	4)	Resolution	Resolve the problem by critical evaluation of the solution

Giving **personalized feedback** to learners of their level of CP can help them understand what level of CP their posts are and how to improve the quality of the posts.

This is usually done by the content analysis of human qualitative coding based on the CP coding framework by Garrison et al., 2001 and revised by Shea et al. (2010). Castellos-Reyes et al. (2024) adapted the LLM-Assisted Content Analysis (LACA) to create an Aladapted CP codebook by Shea et al. (2010) to automatically code CP. This study explores how to apply the AI-adapted CP codebook to analyze students' CP.

RQ1: How accurate are GPT-4.0 models in classifying students' cognitive presence compared with manual human coding? **RQ2:** What other insights do automated content analysis using GPT-4.0 models reveal regarding cognitive presence in asynchronous online discussions?

We sampled a random 5% (n=489) of posts from (1) an undergraduate course Introduction to Instructional Design (n=216) and (2) a graduate course Instructional Design (n=273)

Methods

Data Collection and Analysis

The first two authors coded the posts using and adapting an Al-adapted CP codebook (Castellos-Reyes et al., 2024) in 8 iterations We then used **LACA** to code the same posts using a one-shot (with examples) and two-shot approach (without examples)

Undergraduates and Graduates	Cohen k	р	Few-shot was more similar to human coders than one-shot	
CoPilot One Shot (Without Examples)	к=.223	p<0.163		
CoPilot Few Shot (With Examples)	к=.281	p<0.093		
Undergraduates	Cohen k	р	Undergraduate posts	
CoPilot One Shot (Without Examples)	к=.123	p<0.163	had poor strength ir	
CoPilot Few Shot (With Examples)	к=.120	p<0.093	agreement with	
			human coders	
Graduates	Cohen k	р	Graduata poste	
CoPilot One Shot (Without Examples)	к=.350	p<0.001	had fair and	
CoPilot Few Shot (With Examples)	к=.547	p<0.001	moderate strength	
			of agreement with	
			human coders	

Results

Undergraduates and Graduates	Cohen k	р	Few-shot was more
CoPilot One Shot (Without Examples)	κ=.223 κ=.281	p<0.163 p<0.093	similar to human coders than one-shot
CoPilot Few Shot (With Examples)			
Undergraduates	Cohen k	р	Undergraduate posts had poor strength in agreement with
CoPilot One Shot (Without Examples)	к=.123	p<0.163	
CoPilot Few Shot (With Examples)	к=.120	p<0.093	
			human coders
Graduates	Cohen k	р	Graduate nosts
CoPilot One Shot (Without Examples)	к=.350	p<0.001	had fair and
CoPilot Few Shot (With Examples)	к=.547	p<0.001	moderate strength
			of agreement with
			human coders

Undergraduates and Graduates	Cohen k	р	Few-shot was more	
CoPilot One Shot (Without Examples)	к=.223 к=.281	p<0.163 p<0.093	similar to human coders than one-shot	
CoPilot Few Shot (With Examples)				
Undergraduates	Cohen k	р	Undergraduate posts had poor strength in agreement with	
CoPilot One Shot (Without Examples)	к=.123	p<0.163		
CoPilot Few Shot (With Examples)	к=.120	p<0.093		
			human coders	
Graduates	Cohen k	р	Graduate nosts	
CoPilot One Shot (Without Examples)	к=.350	p<0.001	had fair and	
CoPilot Few Shot (With Examples)	к=.547	p<0.001	moderate strength	
			of agreement with	
			human coders	

Discussion and Conclusion

GPT-4.0 can guide graduate students' quality of posts (k=.547) better than undergraduate (k=.120). Students can use the **few-shot prompt** as it was more accurate and can be applied in online discussions. Our results differ from Castellanos-Reyes et al (2024).

High agreement between the human coders could be because one of the coders is a native English speaker. This may have implications for coding English text (Castellanos-Reyes et al., 2024)

UF UNIVERSITY of **FIORIDA**

Generally, high agreement between the two human coders, which was resolved before comparing with GPT-4.0
